You are free to:

- **Share** — copy and redistribute the material in any medium or format
- **Adapt** — remix, transform, and build upon the material for any purpose, even commercially.

The licensor cannot revoke these freedoms as long as you follow the license terms.

Under the following terms:

- **Attribution** — You must give appropriate credit, provide a link to the license, and indicate if changes were made. You may do so in any reasonable manner, but not in any way that suggests the licensor endorses you or your use.
- **ShareAlike** — If you remix, transform, or build upon the material, you must distribute your contributions under the same license as the original.
- **No additional restrictions** — You may not apply legal terms or technological measures that legally restrict others from doing anything the license permits.

Compressing files

- Various utilities and files formats are available on Linux.
- *zip* is an easy solution when you need compatibility with other systems.
- *tar* (historically “tape archiver”) is usually the go-to tool to manipulate archives files along with *gzip* or *xz*, used for compression.

Manipulating zip archives

- Permissions and ownership are not supported.
- Create: *zip <archive>.zip <file>*
- Extract: *unzip <archive>.zip <file>*

tar archives

- *tar* will aggregate multiples files in one, keeping the directory structure, the file permissions, ownership and other information.
- By itself *tar* doesn't compress the data. Additional libraries are used for that purpose.
- A tar file is sometimes refered as a *tarball*.

Manipulating `tgz` archives

- The *gzip* compressor can be used with *tar* to produce `.tgz` or `.tar.gz` files.
- Create: `tar cvfz <archive>.tgz <file>`
- Extract: `tar xvfz <archive>.tgz <file>`

Manipulating txz archives

- The xz compressor can be used with tar to produce .txz or .tar.xz files.
- Create: *tar cvfJ <archive>.txz <file>*
- Extract: *tar xvfJ <archive>.txz <file>*

Synchronizing files

- archive files can be used to maintain files consistency between systems, but a delay is added.
- *rsync* can be used to maintain a more real-time synchronization.

rsync

- This tool can be used to maintain files and directories synchronized across different locations (on the same system, or different systems).
- *rsync* can use its own network protocol, or be used with SSH for additional security.
- Basic usage:
rsync -a <source> <destination>

Email encoding

- When attaching files to an email, the MIME standard is required to convert files to ASCII characters. This is performed by transforming the files using base64 encoding.
- Base64 files are larger (by 33%), not smaller.
- MIME: Multipurpose Internet Mail Extensions
- ASCII: American Standard Code for Information Interchange
- base64: encoding algorithm using letters (uppercase and lowercase), numbers, characters plus and slash. The equal sign is used for padding if needed.

mimencode

- Encoding a file:
- *mimencode <input file> -o <output file>*
- Decoding a file:
- *mimencode -u <input file> -o <output file>*
